1 Description

1.1 Overview

[HT-HC01](#) is a Wi-Fi HaLow module with excellent RF performance, which operates in 902 - 928MHz, with maximum data rates of 32.5Mbps and up to 1-2km transmission range.

HT-HC01 uses LLC package, small size and rich pin, can be very convenient to integrate in a variety of PCB. It includes ultra-long range PA, high linear LNA, T/R switching, 32 MHz crystal oscillator, and is designed to simplify Wi-Fi HaLow connectivity to external hosts for applications.

HT-HC01 meets IEEE 802.11ah standard, which is specifically designed for battery-operated devices, allowing them to remain in longer sleep and idle states without frequent wake-ups. This significantly reduces power consumption and extends the device's battery life. As a result, HT-HC01 becomes an ideal choice for Internet of Things (IoT) devices and other battery-powered equipment.

1.2 Features

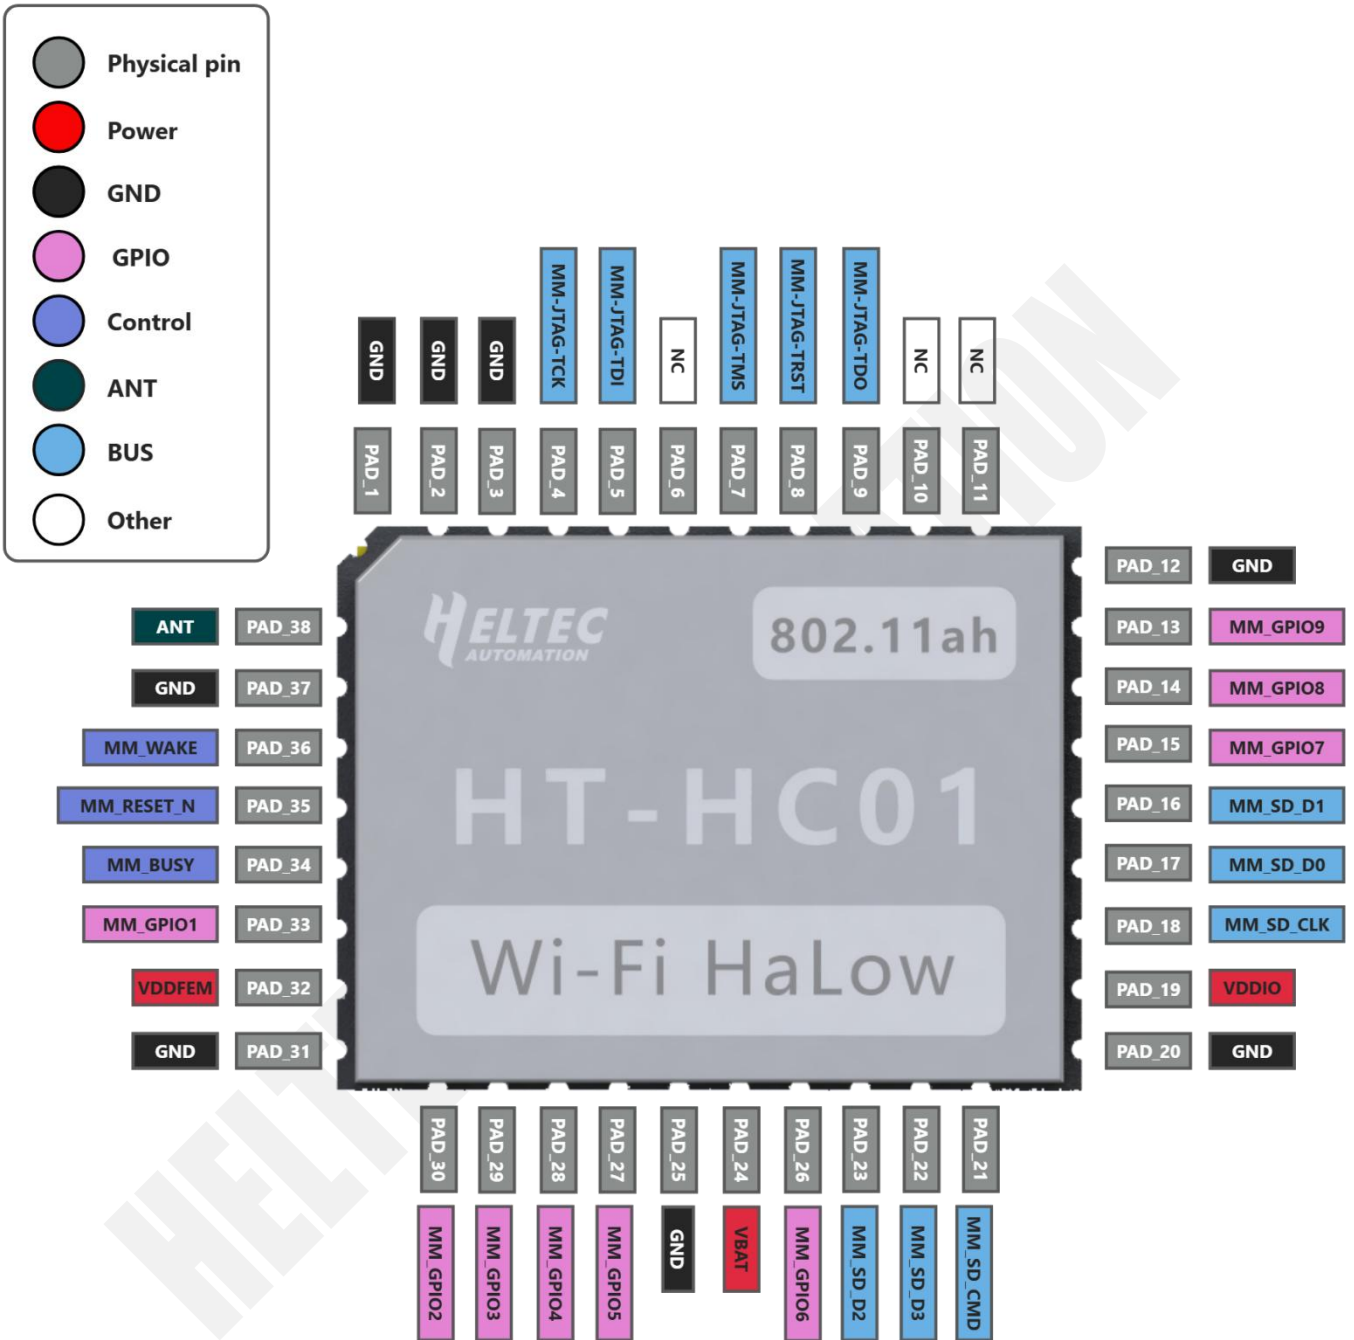

- Long-range transmission, up to 1km or and further within the visual distance.
- Channel bandwidth options of 1/2/4/8 MHz.
- High data rate, single-stream max. data rate of 32.5 Mbps @ 8 MHz or 15 Mbps @ 4 MHz channel.
- Support Sub-1 GHz frequency bands, frequency range: 902~928 MHz.
- Max output power:21dBm.
- 802. 11ah OFDM PHY supporting WFA HaLow certification.
- 802. 11ah MAC supporting WFA HaLow certification.
- Support for various interface options, include SDIO 2.0, 2* UART..
- Hibernate mode (internal / external wake).
- Integrated DC-DC converter supporting a voltage supply from 3.0V to 3.6V.
- 1.27mm stamp hole design, easy to integrate.
- Wide spectrum of security features.

1.3 Application

Wi-Fi HaLow can seamlessly integrate with traditional Wi-Fi or Ethernet networks and is suitable for most IoT scenarios, especially those requiring long-range high-speed transmission

- ✔ Remote camera monitoring
- ✔ Industrial automation control
- ✔ Asset management and tracking
- ✔ Smart home
- ✔ Smart city
- ✔ Smart farming
- ✔ Construction Site Management
- ✔ Wi-Fi/Ethernet/Wi-Fi_HaLow extension and bridging
- ✔ WiFi HaLow device development
- ✔ Proximity sensors
- ✔ Rural internet access
- ✔ Autonomous driving
- ✔ Mobile phone location
- ✔ Environmental monitoring
- ✔ Unmanned supermarket
- ✔ Commodity management
- ✔ Intelligent lighting controls
- ✔ Digital transformation of legacy equipment

NOTE:

- JTAG pins should be tied to GND via a 10k pull down resistor
- All unused GPIO should be tied to GND via a 10k pull down resistor
- All SDIO bus pins should be pull up with a 10k-100k resistor as per the the SDIO standard
- Pending software support
- Supplied from VBAT domain. Other digital pins are driven by VDDIO domain.

3 Specifications

3.1 General Specifications

Table 3.1 General specifications

Parameters	Description
Main Chip	MM6108IQ
Power Supply	3.0~3.6V
HaLow Standard	IEEE 802.11ah
Band Width	1/2/4/8MHz
Interface	38 Header Pins
Pin Package	LLC
Power consumption	See table 3.4
Operating temperature	-40 ~ 85°C
Operating humidity	10% ~ 90%, no-condensing
Dimensions	18.5*14*26mm
Data Rate	32.5 Mbps @ 8 MHz

3.2 Electrical characteristics

3.2.1 Absolute max ratings

Stress beyond absolute maximum ratings may cause permanent damage to the module. Functional operation is guaranteed for recommended operation conditions only. Operation of the device outside the recommended conditions may result in a reduced lifetime and/or reliability problems (even if the absolute maximum ratings are not exceeded).

Table3.2.1 Absolute max ratings

Parameter	Min	Max	Unit
VBAT voltage	-0.3	4.3	V
VDD_FEM voltage	-0.3	4.3	V
Voltage on digital I/O pin	-0.3	4.3	V
Voltage on analog/RF pin	-0.3	1.2	V
Storage temperature	-40	125	°C
RF input power (CW)	-	6	dBm

3.2.2 Immunity

Table3.2.2 Immunity

Parameter	Min	Max	Unit		
Electrostatic discharge(ESD) performance	Human body model (H3M),perANSI/ESDA/JED EC JS001	RF Input	-1000	1000	V
	Charged device model (CDM),perJESD22-C101	All pins except RF Input	-2000	2000	V
		All pins	-500	500	V

4 Reference Design

https://resource.heltec.cn/download/HT-HC01/Reference_design

HELTEC AUTOMATION

4.2 Requirements and considerations

4.2.1 SDIO host requirements

- The host should support SDIO v2.0 with SDIO clock speeds of up to 50 MHz. Slower clock speeds will impact the maximum achievable throughput.
- At a minimum, 2 x GPIOs are required as a CMOS output to drive the RESET and WAKE signals. If power save is used, a third GPIO is needed, set as a CMOS input to receive the BUSY signal from the module.
- The SDIO data and command lines should be pulled up with 10k-100k resistors as per the SDIO 2.0 specification.

4.2.2 SPI host requirements

When selecting a CPU host to interface via SPI to the MM6108-MF08551 module, consider the following recommendations to achieve the best throughput::

- The host should support level-triggered interrupts.
- The host should support full-duplex SPI mode.
- The host should support DMA backed transactions on the SPI bus.

Standard SPI can achieve up to 25 Mbps at 50 MHz but this will reduce significantly if there is no DMA support. For example, an SPI interface with an 8-byte buffer per transaction might only achieve 2Mbps throughput on the SPI bus.

4.2.3 Power management

MM6108-MF08551 module power is derived from a 3.0 to 3.6V supply provided on pins VBAT and VDD_FEM. VBAT powers the internal circuitry of the MM6108 and VDD_FEM powers the on-board ultra-long-range power amplifier.

<https://heltec.org>

VDDIO sets the IO voltage of the MM6108 and should be connected to the same power supply as the host MCU.

There are no strict power-up sequencing requirements, however the voltage on VDDIO must not exceed VBAT.

4.2.4 Digital interfaces

All unused digital IO pins must be pulled up or down to ensure they do not float. Failure to do so will result in a higher leakage current on the VDDIO supply.
