1. **Over View**

The display is a TFT active matrix electrophoretic display, with interface and a reference system design. The 1.54” active area contains $152 \times 152$ pixels, and has 1-bit white/black full display capabilities. An integrated circuit contains gate buffer, source buffer, interface, timing control logic, oscillator, DC-DC, SRAM, LUT, VCOM, and border are supplied with each panel.

2. **Features**

- High contrast
- High reflectance
- Ultra wide viewing angle
- Ultra low power consumption
- Pure reflective mode
- Bi-stable
- Commercial temperature range
- Landscape, portrait mode
- Antiglare hard-coated front-surface
- Low current deep sleep mode
- On chip display RAM
- Waveform stored in On-chip OTP
- Serial peripheral interface available
- On-chip oscillator
- On-chip booster and regulator control for generating VCOM, Gate and source driving voltage
- $^1C$ Signal Master Interface to read external temperature sensor
- Available in COG package IC thickness 280um

Note 5-1: This pin (CS#) is the chip select input connecting to the MCU. The chip is enabled for MCU communication only when CS# is pulled Low.
Note 5-2: This pin (D/C#) is Data/Command control pin connecting to the MCU. When the pin is pulled HIGH, the data will be interpreted as data. When the pin is pulled Low, the data will be interpreted as command.

Note 5-3: This pin (RES#) is reset signal input. The Reset is active Low.

Note 5-4: This pin (BUSY) is Busy state output pin. When Busy is Low, the operation of chip should not be interrupted and any commands should not be issued to the module. The driver IC will put Busy pin Low when the driver IC is working such as:
- Outputting display waveform; or
- Programming with OTP
- Communicating with digital temperature sensor

Note 5-5: This pin (BS1) is for 3-line SPI or 4-line SPI selection. When it is “Low”, 4-line SPI is selected. When it is “High”, 3-line SPI (9 bits SPI) is selected. Please refer to below Table.

RES[1:0]: Display Resolution setting (source x gate)
- 00b: 96x230 (Default)  Active source channels: S0 ~ S95. Active gate channels: G0 ~ G229.
- 01b: 96x252  Active source channels: S0 ~ S95. Active gate channels: G0 ~ G251.
- 10b: 128x296  Active source channels: S0 ~ S127. Active gate channels: G0 ~ G251.
- 11b: 160x296  Active source channels: S0 ~ S159. Active gate channels: G0 ~ G251.

REG_EN: LUT selection
- 0: LUT from OTP. (Default)
- 1: LUT from register.

BWR: Black / White / Red
- 0: Pixel with B/W/Red. (Default)
- 1: Pixel with B/W.

UD: Gate Scan Direction
- 0: Scan down. First line to last line: Gn-1 → Gn-2 → Gn-3 → … → G0
- 1: Scan up. (default) First line to last line: G0 → G1 → G2 → … → Gn-1

SHL: Source Shift direction
- 0: Shift left First data to last data: Sn-1 → Sn-2 → Sn-3 → … → S0
- 1: Shift right. (default) First data to last data: S0 → S1 → S2 → … → Sn-1

SHD_N: Booster Switch
- 0: Booster OFF, register data are kept, and SEG/BG/VCOM are kept 0V or floating.
- 1: Booster ON  (Default)

When SHD_N become LOW, charge pump will be turned OFF, register and SRAM data will keep until VDD OFF, and SD output and VCOM will remain previous condition. SHD_N may have two conditions: 0v or floating.

RST_N: Soft Reset
- 1: No effect  (Default). Booster OFF, Register data are set to their default values, and SEG/BG/VCOM: 0V
- 0: When RST_N become LOW, the driver will be reset, all registers will be reset to their default value. All driver functions will be disabled. SD output and VCOM will base on previous condition. It may have two conditions: 0v or floating.

This command starts transmitting data and write them into SRAM. To complete data transmission, command DSP (Data transmission Stop) must be issued. Then the chip will start to send data/VCOM for panel.

In B/W mode, this command writes “OLD” data to SRAM.

In B/W/Red mode, this command writes “B/W” data to SRAM.

In Program mode, this command writes “OTP” data to SRAM for programming.

To stop data transmission, this command must be issued to check the data_flag.

Data_flag: Data flag of receiving user data.

0: Driver didn’t receive all the data.
1: Driver has already received all the one-frame data (DTM1 and DTM2).
After “Data Start” (R10h) or “Data Stop” (R11h) commands and when data_flag=1, the refreshing of panel starts and BUSY signal will become “0”.

While user sent this command, driver will refresh display (data/VCOM) according to SRAM data and LUT.

After Display Refresh command, BUSY signal will become “0” and the refreshing of panel starts.

(12) VCOM LUT (LUTC) (R20H)

This command builds Look-up Table for VCOM

(13) W2W LUT (LUTWW) (R21H)

This command builds Look-up Table for White-to-White.

(14) B2W LUT (LUTBW/LUTR) (R22H)

- The Typical power consumption is measured with following pattern transition: from horizontal 2 gray scale pattern to vertical 2 gray scale pattern.(Note 7-1)
- The standby power is the consumed power when the panel controller is in standby mode.
- The listed electrical/optical characteristics are only guaranteed under the controller & waveform provided by Qiyun Display.
- Vcom is recommended to be set in the range of assigned value ± 0.1V.

7-3-2) MCU Interface
7-3-2-1) MCU Interface Selection

In this module, there are 4-wire SPI and 3-wire SPI that can communicate with MCU. The MCU interface mode can be set by hardware selection on BS1 pins. When it is “Low”, 4-wire SPI is selected. When it is “High”, 3-wire SPI (9 bits SPI) is selected.

7-3-2-2) MCU Serial Interface (4-wire SPI)

The 4-wire SPI consists of serial clock SCLK, serial data SDIN, D/C#, CS#. In SPI mode, D0 acts as SCLK, D1 acts as SDIN.

SDIN is shifted into an 8-bit shift register in the order of D7, D6, ... D0. The data byte in the shift register is written to the Graphic Display Data RAM (RAM) or command register in the same clock. Under serial mode, only write operations are allowed.

![Write procedure in 4-wire Serial Peripheral Interface mode](image)

Figure 7-1: Write procedure in 4-wire Serial Peripheral Interface mode
7-3-2-3) MCU Serial Interface (3-wire SPI)

The 3-wire serial interface consists of serial clock SCLK, serial data ADIN and CS#.

In 3-wire SPI mode, D0 acts as SCLK, D1 acts as SDIN. The pin D/C# can be connected to an external ground.

The operation is similar to 4-wire serial interface while D/C# pin is not used. There are altogether 9-bits will be shifted into the shift register on every ninth clock in sequence: D/C# bit, D7 to D0 bit. The D/C# bit (first bit of the sequential data) will determine the following data byte in shift register is written to the Display Data RAM (D/C# bit = 1) or the command register (D/C# bit = 0). Under serial mode, only write operations are allowed.

Note 9-1: Luminance meter: Eye – One Pro Spectrophotometer
Note 9-2: Panel life will not guaranteed when work in temperature below 0 degree or above 50 degree. Each update interval time should be minimum at 180 seconds.

9-2) Definition of contrast ratio
The contrast ratio (CR) is the ratio between the reflectance in a full white area (R1) and the reflectance in a dark area (Rd) :

\[ CR = \frac{R_1}{R_d} \]

WS: White state, DS: Dark state
Gray state from Dark to White : DS、WS
m: 2

Note 9-1: Luminance meter: Eye – One Pro Spectrophotometer
Note 9-2: Panel life will not guaranteed when work in temperature below 0 degree or above 50 degree. Each update interval time should be minimum at 180 seconds.
9-3) Reflection Ratio

The reflection ratio is expressed as:

\[
R = \text{Reflectance Factor}_{\text{white board}} \times \left( \frac{L_{\text{center}}}{L_{\text{white board}}} \right)
\]

\(L_{\text{center}}\) is the luminance measured at center in a white area (R=G=B=1). \(L_{\text{white board}}\) is the luminance of a standard white board. Both are measured with equivalent illumination source. The viewing angle shall be no more than 2 degrees.

Observe general precautions that are common to handling delicate electronic components. The glass can break and front surfaces can easily be damaged. Moreover the display is sensitive to static electricity and other rough environmental conditions.
